

MANNOL Ester Additive 9929

Innovative engine protection agent based on synthetic esters (oils of Group V). Metal surfaces attract ester molecules, forming a dense oil film that reduces friction and wear. Esters minimize fuel consumption and increase engine life. Thanks to low evaporation and high thermal-oxidative stability the additive prolongs oil life. Increased washing and dispersing properties prevent tar and sludge deposits. Penetrates into gaskets and rubber seals, restores their former volume and elasticity, preventing oil leakage. Guarantees smooth cold start. Compatible with all construction materials.

Application: Mix in a ratio of 500 ml per 5 L of engine oil. Recommended for regular use.
